Unéo

With over 1.1 million people covered, 630 employees and €654 M in contributions (incl. taxes), Unéo is the number one mutual insurance company for the defence sector. Unéo has been contracted by the Ministry of the Armed Forces to provide cover for military personnel and civilians in the sector since 2011. Established in 2008 via the merger of the healthcare branch of la Caisse Nationale du Gendarme (CNG), la Mutuelle Nationale Militaire (MNM) and la Mutuelle de l'Armée de l'Air (MAA), Unéo provides health and provident fund insurance cover to all of the armed forces (army, air force, navy, national police, administrative units and departments).

This cover applies to military personnel in France, in French overseas departments and abroad who are on active duty, have transitioned into new careers or are retired, and civilians in the defence sector, as well as their families. Nearly 90% of employees at the Ministry of the Armed Forces currently choose Unéo.

Our goal is to be there for those who work in the national interest.

Background

Unéo is the number one mutual insurance company for the defence sector and number two in civil service, **and its protection covers 1.1m users**. In order to fulfil its mission to support its customers, this non-profit organisation sends mutual insurance advisors to visit military facilities. Unéo is particularly concerned with data security due to the sensitive nature of the personal data entrusted to it. Anyone who lowers their guard or is subject to a cyber attack can cause a data breach or data loss. It's as easy as having your laptop stolen in a hotel, forgetting your smartphone in a taxi, or having your device hacked through a hacked WiFi connection.

A poorly secured workstation can endanger not only the data processed at that station, but the data on the networks to which it is connected, as well.

To lower the risk of a data breach, Unéo has worked in close collaboration with the Ministry of the Armed Forces to find a trustworthy solution for encrypting its range of mobile work equipment.

The solution of choice

Amongst all of the solutions available on the market, Unéo chose Stormshield Endpoint Security (SES). This software package takes a comprehensive approach to preventing data breaches through its Device Control, APT Protection and Encryption modules.

In addition to its features, **Unéo chose to place its trust in SES because of the peace of mind afforded by** the CC EAL3+ European certification. "Stormshield is a certified professional that comes with a guarantee of trustworthiness. We chose Stormshield for its quality product and the guarantee of airtight data protection," explained Antoine Bonneville, CISO and head of business continuity at Unéo.

A trustworthy, solution, certified by the EU ANSSI

This data security guarantee is even stronger considering that Stormshield regularly undergoes certification processes with the French National Cybersecurity Agency (ANSSI).

By creating Security Visas, Stormshield became the trusted software publisher with the greatest coverage in terms of security needs.

This government certification is testimony to the compliance of Stormshield's solutions with the regulatory, technical and security requirements promoted by the ANSSI, including in-depth assessments, source code protection, vulnerability assessments, and physical audits of the company's organisation to check the premises' security level, etc.

A solution that's easy to roll-out and easy to use

Stormshield Endpoint Security's architecture is easily integrated, so Unéo was able to dispatch agents and conduct in-depth assessments of mobile equipment conveniently from one central administration console.

Stormshield Endpoint Security is also unique in that it can be rolled out individually for each employee in successive waves as opposed to a mass roll-out.

Unéo was therefore able to effortlessly grasp the software. For the CISO and head of business continuity at Unéo, the roll-out went very smoothly and our employees required no additional support.

Encryption

Stormshield Endpoint Security enables you to maintain the confidentiality of data hosted on workstations in Legacy BIOS mode.

This encryption prevents the illegal use of personal and confidential data (GDPR) in the event that a laptop is stolen. **SES offers two levels of encryption that can be combined: full disk encryption (or surface encryption) and on-the-fly encryption for files.**

STORMSHIELD

Stormshield, a wholly-owned subsidiary of Airbus CyberSecurity, offers innovative, end-to-end security solutions for the protection of IT networks (Stormshield Network Security), workstations (Stormshield Endpoint Security) and data (Stormshield Data Security).
